

Collection Pests Data Diagram

OBSERVATIONS	
ID	Unique to each observation
Trap ID	Which trap?
Pest ID	What Pest
Inspected	Date of inspection
Count	How many pests
Stage	What stage of pest
Notes	
Date Entered	When entered in db

TRAPS	
ID	Unique to each trap
Trap Name or other identifier	
Installed	date installed
Lifeindays	How long to leave it out
Check Interval	Check every x days
Removed	when taken out of service
Notes	
Photo?	
Site	ie: East Campus West Campus
Building	
Floor	
Room	
Area	
Mapid	associated to which map?
X	x position on map
Y	y position on map

PEST TABLE	
ID	Unique to each pest
Common	common name
Scientific	
Risk	
Eco Type	
Order	
Photo ?	0 if none else 1
Citation	
Notes	

RISK	
ID	unique to each risk
Risk	

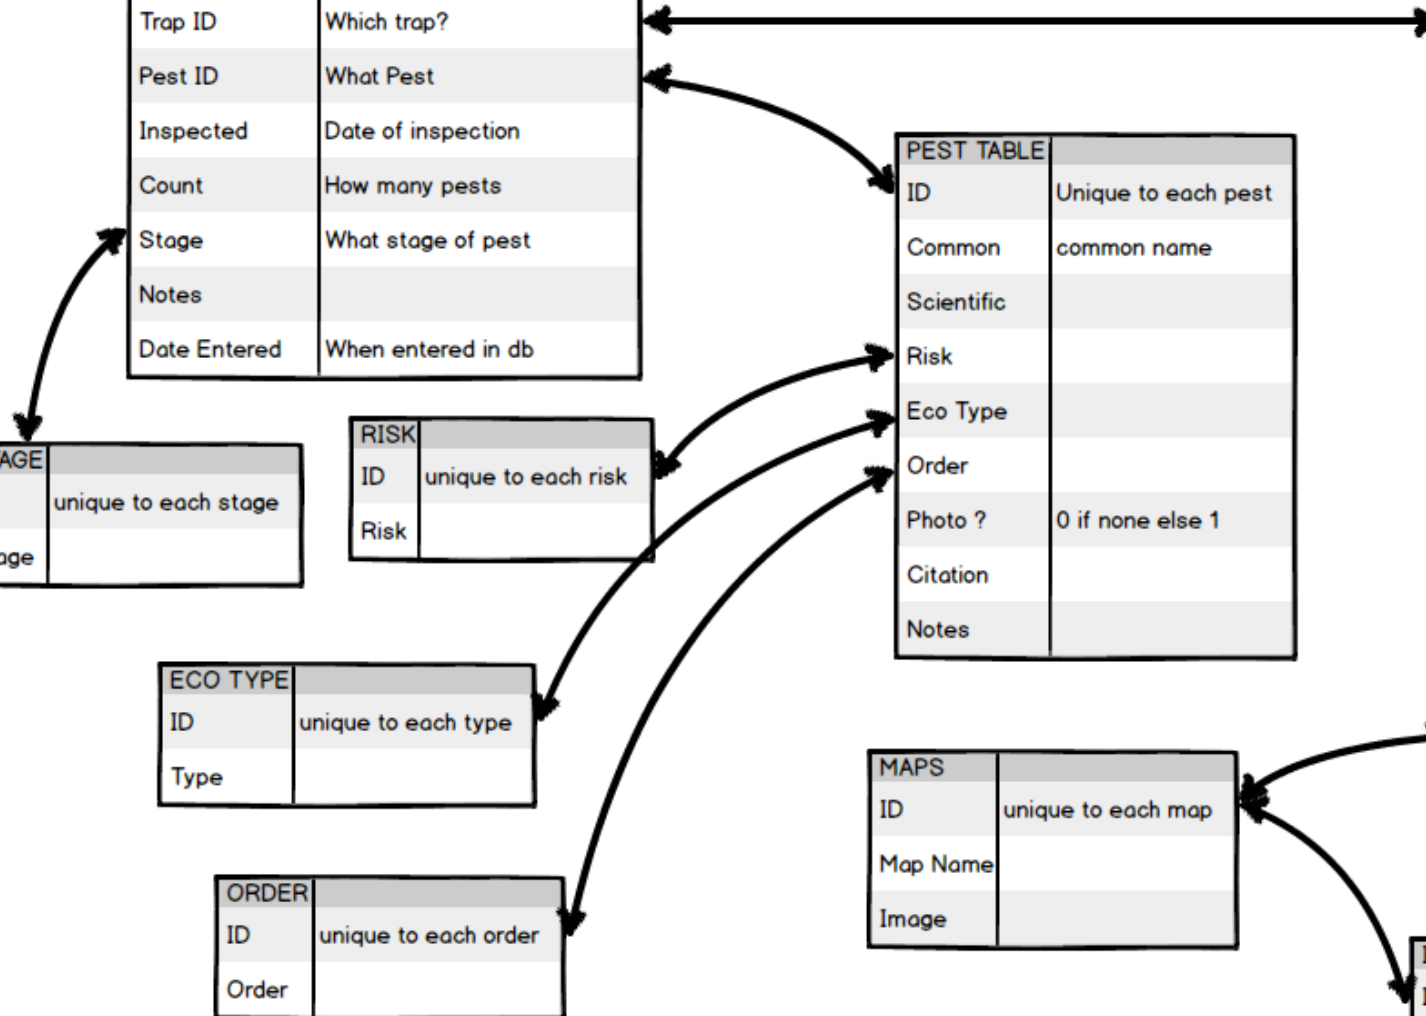

ECO TYPE	
ID	unique to each type
Type	

ORDER	
ID	unique to each order
Order	

MAPS	
ID	unique to each map
Map Name	
Image	

ICON LIST	
ID	unique to each icon
Mapid	which map is it on?
Left	location
Top	location
Notes	
Icon	show which icon

Collections Pests use a relational database system, some versions use MS Access, some MYSQL.

ECO TYPE
Type

Zpests doesn't use a true database. It uses CSV files (Excel type) as it's storage.

When the program starts it reads the CSV files and loads them into a temporary, memory based database.

The PEST LIST and ECO TYPE files are used to populate the dropdowns - this helps with consistency of labeling.
